

Comp-3150: Database Management Systems

- Ramez Elmasri, Shamkant B. Navathe (2016) Fundamentals of Database Systems (7th Edition), Pearson, isbn 10: 0-13-397077-9; isbn-13: 978-0-13-397077-7.
- Chapter 6: BASIC SQL

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from: Elmasri & Navathe, 7th

1

Chapter 6: BASIC SQL: Outline

- 1. SQL Data Definition and Data Types
- 2. Specifying Constraints in SQL
- 3. Basic Retrieval Queries in SQL
- 4. INSERT, DELETE, and UPDATE Statements in SQL

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from: Elmasri & Navathe, 7th

2

1. SQL Data Definition and Data Types

- SQL language
 - Considered one of the major reasons for the commercial success of relational databases
- SQL stands for "structured Query Language" although it originally came from the word SEQUEL in its introduction.
- SQL is one of the major reasons for the success of the commercial relational model as it makes DB application migration easy with most DBMS's using it.

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from: Elmasri & Navathe, 7th Ed

3

1. SQL Data Definition and Data Types: SQL Standards

- SQL has gone through many standards: starting with SQL-86 or SQL 1. SQL-92 is referred to as SQL-2.
- Later standards (from SQL-1999) are divided into **core** specification and specialized **extensions**. The extensions are implemented for different applications – such as data mining, data warehousing, multimedia etc.
- SQL-2006 added XML features; In 2008 they added Object-oriented features.
- SQL-3 is the current standard which started with SQL-1999. It is not fully implemented in any RDBMS

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from: Elmasri & Navathe, 7th Ed

4

1. SQL Data Definition and Data Types: SQL Standards

- **Terminology:**
 - **Table, row, and column** are used for the relational model terms relation, tuple, and attribute respectively.
- SQL language has features for :
 - 1. Data definition (called DDL or data definition language),
 - 2. Data Manipulation (called DML or data manipulation language),
 - 3. Transaction control (Transact-SQL), (4) Indexing , (5) Security specification (Grant and Revoke), etc. (called data control lang. or DCL)
- **CREATE statement**
 - Main SQL command for data definition is the CREATE statement

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from: Elmasri & Navathe, 7th Ed

5

1. SQL Data Definition and Data Types: The CREATE SCHEMA command in SQL

- We cover the basic standard SQL syntax – there are variations in existing RDBMS systems
- **1. SQL schema (that is the database):**
 - 1. Identified by a **schema name**, and
 - 2. Includes an **authorization identifier** (eg 'Jsmith') to indicate the **owner of the schema** and **descriptors** (eg. Grant select) for each element
- **Schema elements** include
 - Tables, constraints, views, domains, and other constructs
- Not all users are authorized to create schemas and schema elements.
- Each statement in SQL ends with a **semicolon**

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from: Elmasri & Navathe, 7th Ed

6

1. SQL Data Definition and Data Types: The CREATE SCHEMA command in SQL

- For example, to create a database schema called COMPANY, use:
 - **CREATE SCHEMA statement**
 - `CREATE SCHEMA COMPANY AUTHORIZATION 'Jsmith';`
 - **The above does not list the schema elements and those can be defined later.**
- **Catalog**
 - Named collection of schemas in an SQL environment
 - A catalog contains a special schema called INFORMATION_SCHEMA for providing information on all schemas and element descriptors in these schemas.

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from: Elmasri & Navathe, 7th Ed

7

1. SQL Data Definition and Data Types: The CREATE TABLE Command in SQL

- **2. The CREATE TABLE Command in SQL:**
- Is used to specify a new relation and it:
 - Provides name of the table
 - Specifies attributes, their types and initial constraints
- Can optionally specify schema as:
 - `CREATE TABLE COMPANY.EMPLOYEE ...`
 - or
 - `CREATE TABLE EMPLOYEE ...`
 - Note that the Oracle DBMS SQL implementation on our CS server has data types VARCHAR2 (not VARCHAR), NUMBER (not DECIMAL or INT).

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from: Elmasri & Navathe, 7th Ed

8

1. SQL Data Definition and Data Types: The CREATE TABLE Command in SQL

```
CREATE TABLE EMPLOYEE
(Fname VARCHAR(15) NOT NULL,
Minit CHAR,
Lname VARCHAR(15) NOT NULL,
Ssn CHAR(9) NOT NULL,
Bdate DATE,
Address VARCHAR(15),
Sex CHAR,
Salary DECIMAL(10, 2),
Super_ssn CHAR(9),
Dno INT NOT NULL,
PRIMARY KEY(Ssn));
```

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

9

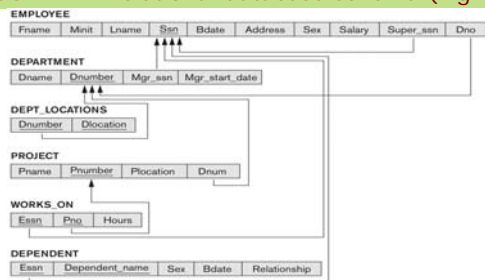

1. SQL Data Definition and Data Types: The CREATE TABLE Command in SQL

- **Base tables (base relations)**
 - Relation and its tuples are actually created and stored as a file by the DBMS
- **Virtual relations (views)**
 - Created through the **CREATE VIEW** statement. Do not correspond to any physical file.

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

10

1. SQL Data Definition and Data Types: COMPANY relational database schema (Fig. 5.7)

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

13

SQL CREATE TABLE data definition statements for defining the COMPANY schema from Figure 5.7 (Fig. 6.1)

```
CREATE TABLE EMPLOYEE
( Fname          VARCHAR(15)      NOT NULL,
  Minit          CHAR(1)         NOT NULL,
  Lname         VARCHAR(15)      NOT NULL,
  Ssn            CHAR(9)         NOT NULL,
  Bdate         DATE,
  Address       VARCHAR(30),
  Sex           CHAR,
  Salary        DECIMAL(10,2),
  Super_ssn     CHAR(9),
  Dno           INT              NOT NULL,
  PRIMARY KEY (Ssn));

CREATE TABLE DEPARTMENT
( Dname          VARCHAR(15)      NOT NULL,
  Dnumber       INT              NOT NULL,
  Mgr_ssn       CHAR(9)         NOT NULL,
  Mgr_start_date DATE,
  PRIMARY KEY (Dnumber),
  UNIQUE (Dname),
  FOREIGN KEY (Mgr_ssn) REFERENCES EMPLOYEE(Ssn) );

CREATE TABLE DEPT_LOCATIONS
( Dnumber       INT              NOT NULL,
  Dlocation     VARCHAR(15)      NOT NULL,
  PRIMARY KEY (Dnumber, Dlocation),
  FOREIGN KEY (Dnumber) REFERENCES DEPARTMENT(Dnumber) );
```

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

14

SQL CREATE TABLE data definition statements for defining the COMPANY schema from Figure 5.7 (Fig. 6.1)

```
CREATE TABLE PROJECT
( Pname          VARCHAR(15)      NOT NULL,
  Pnumber       INT              NOT NULL,
  Plocation     VARCHAR(15),
  Dnum          INT              NOT NULL,
  PRIMARY KEY (Pnumber),
  UNIQUE (Pname),
  FOREIGN KEY (Dnum) REFERENCES DEPARTMENT(Dnumber) );

CREATE TABLE WORKS_ON
( Essn           CHAR(9)         NOT NULL,
  Pno            INT              NOT NULL,
  Hours         DECIMAL(3,1)    NOT NULL,
  PRIMARY KEY (Essn, Pno),
  FOREIGN KEY (Essn) REFERENCES EMPLOYEE(Ssn),
  FOREIGN KEY (Pno) REFERENCES PROJECT(Pnumber) );

CREATE TABLE DEPENDENT
( Essn           CHAR(9)         NOT NULL,
  Dependent_name VARCHAR(15)     NOT NULL,
  Sex           CHAR,
  Bdate         DATE,
  Relationship   VARCHAR(8),
  PRIMARY KEY (Essn, Dependent_name),
  FOREIGN KEY (Essn) REFERENCES EMPLOYEE(Ssn) );
```

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

15

1. SQL Data Definition and Data Types:
The CREATE TABLE Command

Some foreign keys may cause errors

- Specified either via:
 - Circular references
 - Or because they refer to a table that has not yet been created
- Example circular reference is foreign key Super_ssn in EMPLOYEE table which refers to Ssn in the EMPLOYEE table.
- The foreign key Dno in EMPLOYEE table refers to the DEPARTMENT table not yet created.
- One solution to these problems is to leave the constraints out during the initial creation of the table and use the ALTER TABLE statement to change them when they can no longer cause a violation.

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

16

1. SQL Data Definition and Data Types: Attribute Data Types and Domains in SQL

• 3. Attribute Data Types and Domains in SQL

■ Basic data types (Six main types)

■ 1. Numeric data types

- i. Integer numbers: INTEGER, INT, and SMALLINT
- ii. Floating-point (real) numbers: FLOAT or REAL, and DOUBLE PRECISION

■ 2. Character-string data types

- i. Fixed length: CHAR(*n*), CHARACTER(*n*)
- ii. Varying length: VARCHAR(*n*), CHAR VARYING(*n*), CHARACTER VARYING(*n*)
- Varying large text: CHARACTER LARGE OBJECT or CLOB. Eg. CLOB(20M) specifies a maximum of 20MB of text.

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from: Elmasri & Navathe, 7th Ed

17

1. SQL Data Definition and Data Types: Attribute Data Types and Domains in SQL

■ 3. Bit-string data types

- i. Fixed length: BIT(*n*), e.g., B'10101'
- ii. Varying length: BIT VARYING(*n*)
- iii. BLOB, e.g. BLOB(30G) for large binary values like images.

■ 4. Boolean data type

- Values of TRUE or FALSE or NULL

■ 5. DATE data type

- has Ten positions with Components as YEAR, MONTH, and DAY in the form YYYY-MM-DD
- Multiple mapping functions available in RDBMSs to change date formats
- Note that the date format on our CS system is dd-mon-yy. For example, 12-aug-55 for 12th August, 1955.

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from: Elmasri & Navathe, 7th Ed

18

1. SQL Data Definition and Data Types: Attribute Data Types and Domains in SQL

■ 6. Additional data types

- i. **Timestamp** data type which Includes the DATE and TIME fields
 - Plus a minimum of six positions for decimal fractions of seconds
 - Optional WITH TIME ZONE qualifier
 - Eg. TIMESTAMP '2014-09-27 09:12:47.648302'
- ii. **INTERVAL** data type
 - Specifies a relative value that can be used to increment or decrement an absolute value of a date, time, or timestamp
- **DATE, TIME, Timestamp, INTERVAL** data types can be **cast** or converted to string formats for comparison.

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from: Elmasri & Navathe, 7th Ed

19

1. SQL Data Definition and Data Types: Attribute Data Types and Domains in SQL

■ Create Domain statement

- can be used to declare the data type of an attribute as SSN_TYPE
 - Example:
 - CREATE DOMAIN SSN_TYPE AS CHAR(9);
 - It makes it easier to change the data type for a domain that is used by numerous attributes
 - And use of domain improves schema readability
- **Create TYPE command can be used to create User Defined Types (UDTs).**

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from: Elmasri & Navathe, 7th Ed

20

2. Specifying Constraints in SQL

Basic constraints:

- Relational Model has 3 basic constraint types that are supported in SQL:
 - **1. Key constraint:** A primary key value cannot be duplicated
 - **2. Entity Integrity Constraint:** A primary key value cannot be null
 - **3. Referential integrity constraints :** The "foreign key " must have a value that is already present as a primary key, or may be null.

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from: Elmasri & Navathe, 7th Ed

21

2. Specifying Constraints in SQL

Other 3 Restrictions on attribute domains are:

- **4. Default value of an attribute**
 - **DEFAULT** <value>
- **5. NULL is not permitted for a particular attribute (NOT NULL)**
- **6. CHECK clause for restricting attribute or domain values at declaration of attribute**
 - `Dnumber INT NOT NULL CHECK (Dnumber > 0 AND Dnumber < 21);`
 - An example CHECK clauses at the end of a CREATE TABLE statement
 - `CHECK (Dept_create_date <= Mgr_start_date);`

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from: Elmasri & Navathe, 7th Ed

22

2. Specifying Constraints in SQL

- 1. Specifying Key and Referential Integrity Constraints
- **i. PRIMARY KEY clause**
 - Specifies one or more attributes that make up the primary key of a relation, e.g.,
 - `Dnumber INT PRIMARY KEY;`
- **ii. UNIQUE clause**
 - Specifies alternate (secondary) keys (called CANDIDATE keys in the relational model), e.g.,
 - `Dname VARCHAR(15) UNIQUE;`

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from: Elmasri & Navathe, 7th Ed

23

2. Specifying Constraints in SQL

- **2. ENTITY integrity is enforced from PRIMARY KEY clause although the NOT NULL can still be specified.**
- **3. FOREIGN KEY clause**
 - Default operation: reject update on violation
 - Attach **referential triggered action clause**
 - Options include `SET NULL`, `CASCADE`, and `SET DEFAULT`
 - Action taken by the DBMS for `SET NULL` or `SET DEFAULT` is the same for both `ON DELETE` and `ON UPDATE`
 - `CASCADE` option suitable for "relationship" relations

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from: Elmasri & Navathe, 7th Ed

24

2. Specifying Constraints in SQL

- Giving Names to Constraints
- Using the Keyword **CONSTRAINT**
 - a constraint can be named for easy later reference and use
- Fig 6.1 and 6.2 given next show some example uses of these constraints while creating tables.

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

25

2. Specifying Constraints in SQL: Figure 6.1 (continued) SQL

CREATE TABLE data definition statements for defining the COMPANY schema from Figure 5.7.

```
CREATE TABLE PROJECT
( Pname          VARCHAR(15)      NOT NULL,
  Pnumber        INT              NOT NULL,
  Plocation      VARCHAR(15),
  Dnum           INT              NOT NULL,
  PRIMARY KEY (Pnumber),
  UNIQUE (Pname),
  FOREIGN KEY (Dnum) REFERENCES DEPARTMENT(Dnumber) );

CREATE TABLE WORKS_ON
( Essn           CHAR(9)          NOT NULL,
  Pno            INT              NOT NULL,
  Hours          DECIMAL(3,1)    NOT NULL,
  PRIMARY KEY (Essn, Pno),
  FOREIGN KEY (Essn) REFERENCES EMPLOYEE(Ssn),
  FOREIGN KEY (Pno) REFERENCES PROJECT(Pnumber) );

CREATE TABLE DEPENDENT
( Essn           CHAR(9)          NOT NULL,
  Dependent_name VARCHAR(15)      NOT NULL,
  Sex            CHAR,
  Bdate          DATE,
  Relationship    VARCHAR(8),
  PRIMARY KEY (Essn, Dependent_name),
  FOREIGN KEY (Essn) REFERENCES EMPLOYEE(Ssn) );
```

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

26

2. Specifying Constraints in SQL: Figure 6.2 Example illustrating how default attribute values and referential integrity triggered actions are specified in SQL.

```
CREATE TABLE EMPLOYEE
( ...
  Dno          INT              NOT NULL      DEFAULT 1,
  CONSTRAINT EMPFK
  PRIMARY KEY (Ssn),
  CONSTRAINT EMPSUPERFK
  FOREIGN KEY (Super_ssn) REFERENCES EMPLOYEE(Ssn)
  ON DELETE SET NULL      ON UPDATE CASCADE,
  CONSTRAINT EMPDEPTFK
  FOREIGN KEY (Dno) REFERENCES DEPARTMENT(Dnumber)
  ON DELETE SET DEFAULT   ON UPDATE CASCADE);

CREATE TABLE DEPARTMENT
( ...
  Mgr_ssn      CHAR(9)          NOT NULL      DEFAULT '0000000000',
  ...
  CONSTRAINT DEPTPK
  PRIMARY KEY (Dnumber),
  CONSTRAINT DEPTSK
  UNIQUE (Dname),
  CONSTRAINT DEPTMGRFK
  FOREIGN KEY (Mgr_ssn) REFERENCES EMPLOYEE(Ssn)
  ON DELETE SET DEFAULT   ON UPDATE CASCADE);

CREATE TABLE DEPT_LOCATIONS
( ...
  PRIMARY KEY (Dnumber, Dlocation),
  FOREIGN KEY (Dnumber) REFERENCES DEPARTMENT(Dnumber)
  ON DELETE CASCADE      ON UPDATE CASCADE);
```

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

27

3. Basic Retrieval Queries in SQL

- **SELECT** statement
 - Is one basic statement for retrieving information from a database
- SQL allows a table to have two or more tuples that are identical in all their attribute values
 - Unlike relational model (relational model which is strictly set-theory based and a set does not allow duplicate elements)
 - In SQL Multiset or bag behavior is possible
 - Tuple-id may be used as a key to enforce tuple uniqueness although this cannot be guaranteed in retrieved results.

Comp-3150 Dr. C. I. Ezelle (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

28

3. Basic Retrieval Queries in SQL: The SELECT-FROM-WHERE Structure of Basic SQL Queries

■ Basic form of the SELECT statement:

```
SELECT <attribute list>
FROM <table list>
WHERE <condition>;
```

where

- <attribute list> is a list of attribute names whose values are to be retrieved by the query.
- <table list> is a list of the relation names required to process the query.
- <condition> is a conditional (Boolean) expression that identifies the tuples to be retrieved by the query.

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

29

3. Basic Retrieval Queries in SQL: The SELECT-FROM-WHERE Structure of Basic SQL Queries

■ Logical comparison operators are:

- =, <, <=, >, >=, and <> (not equal)

■ Projection attributes are:

- Attributes whose values are to be retrieved

■ Selection condition is:

- Boolean condition that must be true for any retrieved tuple. Selection conditions include join conditions when multiple relations are involved.
- A Boolean condition (expression) can be a literal value, an attribute value, or an expression or a conjunction (AND), disjunction (OR), or negation (NOT) of an expression.

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

30

Basic Retrieval Queries

Bdate	Address
1965-01-09	731 Fondren, Houston, TX

Ename	Lname	Address
John	Smith	731 Fondren, Houston, TX
Franklin	Wong	638 Voss, Houston, TX
Ramesh	Narayan	975 Fire Oak, Humble, TX
Joyce	English	5631 Rice, Houston, TX

Query 0. Retrieve the birth date and address of the employee(s) whose name is 'John B. Smith'.

Q0:

```
SELECT Bdate, Address
FROM EMPLOYEE
WHERE Fname='John' AND Minit='B' AND Lname='Smith';
```

Query 1. Retrieve the name and address of all employees who work for the 'Research' department.

Q1:

```
SELECT Fname, Lname, Address
FROM EMPLOYEE, DEPARTMENT
WHERE Dname='Research' AND Dnumber=Dno;
```

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

31

Basic Retrieval Queries (Contd.)

(c)

Pnumber	Dnum	Lname	Address	Bdate
10	4	Wallace	291 Berry, Bellaire, TX	1941-06-20
30	4	Wallace	291 Berry, Bellaire, TX	1941-06-20

Query 2. For every project located in 'Stafford', list the project number, the controlling department number, and the department manager's last name, address, and birth date.

Q2:

```
SELECT Pnumber, Dnum, Lname, Address, Bdate
FROM PROJECT, DEPARTMENT, EMPLOYEE
WHERE Dnum=Dnumber AND Mgr_ssn=Ssn AND
Plocation='Stafford';
```

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

32

Ambiguous Attribute Names

- A query that involves only selection and join conditions plus projection of attributes is called a select-project-join (spj) query.
- Same name can be used for two (or more) attributes in different relations
 - As long as the attributes are in different relations
 - Must **qualify** the attribute name with the relation name to prevent ambiguity as in Q1A below.

Q1A:

```

SELECT      Fname, EMPLOYEE.Name, Address
FROM        EMPLOYEE, DEPARTMENT
WHERE       DEPARTMENT.Name='Research' AND
            DEPARTMENT.Dnumber=EMPLOYEE.Dnumber;
```

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

33

Aliasing, and Renaming

- **Aliases or tuple variables can be used to:**
 - Declare alternative relation names E and S to refer to the EMPLOYEE relation twice in a query:

Query 8. For each employee, retrieve the employee's first and last name and the first and last name of his or her immediate supervisor.

- ```
SELECT E.Fname, E.Lname, S.Fname, S.Lname
FROM EMPLOYEE AS E, EMPLOYEE AS S
WHERE E.Super_ssn=S.Ssn;
```
- Recommended practice is to abbreviate names and to prefix same or similar attribute from multiple tables.

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

34

## Aliasing, Renaming and Tuple Variables (contd.)

- The attribute names can also be renamed  
EMPLOYEE AS E(Fn, Mi, Ln, Ssn, Bd, Addr, Sex, Sal, Sssn, Dno)
- Note that the relation EMPLOYEE now has a variable name E which corresponds to a tuple variable
- The "AS" may be dropped in most SQL implementations

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

35

## Unspecified WHERE Clause and Use of the Asterisk

- **Missing WHERE clause**
  - Indicates no condition on tuple selection
- **Effect is a CROSS PRODUCT**
  - Result is all possible tuple combinations (or the Algebra operation of Cartesian Product— see Ch.8) result

**Queries 9 and 10.** Select all EMPLOYEE Ssns (Q9) and all combinations of EMPLOYEE Ssn and DEPARTMENT Dname (Q10) in the database.

**Q9:**

```

SELECT Ssn
FROM EMPLOYEE;
```

**Q10:**

```

SELECT Ssn, Dname
FROM EMPLOYEE, DEPARTMENT;
```

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

36

### Unspecified WHERE Clause and Use of the Asterisk (cont'd.)

- Specify an asterisk (\*)
  - Retrieve all the attribute values of the selected tuples
  - The \* can be prefixed by the relation name; e.g., EMPLOYEE . \*

Q1C:    **SELECT**       \*  
          **FROM**       EMPLOYEE  
          **WHERE**      Dno=5;

Q1D:    **SELECT**       \*  
          **FROM**       EMPLOYEE, DEPARTMENT  
          **WHERE**      Dname='Research' AND Dno=Dnumber;

Q10A:   **SELECT**       \*  
          **FROM**       EMPLOYEE, DEPARTMENT;

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7<sup>th</sup> Ed

37

### Tables as Sets in SQL

- SQL does not automatically eliminate duplicate tuples in query results
- For aggregate operations (See sec 7.1.7) duplicates must be accounted for
- Use the keyword **DISTINCT** in the **SELECT** clause
  - Only distinct tuples should remain in the result

**Query 11.** Retrieve the salary of every employee (Q11) and all distinct salary values (Q11A).

Q11:    **SELECT**       ALL Salary  
          **FROM**       EMPLOYEE;

Q11A:   **SELECT**       DISTINCT Salary  
          **FROM**       EMPLOYEE;

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7<sup>th</sup> Ed

38

### Tables as Sets in SQL (cont'd.)

- Set operations
  - UNION**, **EXCEPT** (difference), **INTERSECT**
  - Corresponding multiset operations: **UNION ALL**, **EXCEPT ALL**, **INTERSECT ALL**
  - Type compatibility is needed for these operations to be valid

**Query 4.** Make a list of all project numbers for projects that involve an employee whose last name is 'Smith', either as a worker or as a manager of the department that controls the project.

Q4A:    ( **SELECT**       DISTINCT Pnumber  
          **FROM**       PROJECT, DEPARTMENT, EMPLOYEE  
          **WHERE**      Dnum=Dnumber AND Mgr\_ssn=Ssn  
                          AND Lname='Smith' )  
          **UNION**  
          ( **SELECT**       DISTINCT Pnumber  
          **FROM**       PROJECT, WORKS\_ON, EMPLOYEE  
          **WHERE**      Pnumber=Pno AND Essn=Ssn  
                          AND Lname='Smith' );

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7<sup>th</sup> Ed

39

### Substring Pattern Matching and Arithmetic Operators

- LIKE** comparison operator is
  - Used for string **pattern matching**
  - % replaces an arbitrary number of zero or more characters
  - underscore ( ) replaces a single character
  - Examples: **WHERE** Address **LIKE** '%Houston,TX%';
  - WHERE** Ssn **LIKE** '\_ \_ 1 \_ \_ 8901';

- BETWEEN** comparison operator

E.g., in Q14 : Retrieve all employees in dept 5 whose salary is between \$30,000 and \$40,000.

**SELECT** \* **FROM** EMPLOYEE  
**WHERE**(Salary **BETWEEN** 30000 **AND** 40000)  
**AND** Dno = 5;

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7<sup>th</sup> Ed

40

## Arithmetic Operations

- Standard arithmetic operators:
  - Addition (+), subtraction (-), multiplication (\*), and division (/) may be included as a part of **SELECT clause**
- Query 13.** Show the resulting salaries if every employee working on the 'ProductX' project is given a 10 percent raise.

```
SELECT E.Fname, E.Lname, 1.1 * E.Salary AS Increased_sal
FROM EMPLOYEE AS E, WORKS_ON AS W, PROJECT AS P
WHERE E.Ssn=W.Essn AND W.Pno=P.Pnumber AND P.Pname='ProductX';
```

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

41

## Ordering of Query Results

- Use **ORDER BY** clause
  - Keyword **DESC** to see result in a descending order of values
  - Keyword **ASC** to specify ascending order explicitly
  - Typically placed at the end of the query

```
ORDER BY D.Dname DESC, E.Lname ASC, E.Fname ASC
```

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

42

## Basic SQL Retrieval Query Block

```
SELECT <attribute list>
FROM <table list>
[WHERE <condition>]
[ORDER BY <attribute list>];
```

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

43

## 4. INSERT, DELETE, and UPDATE Statements in SQL

- Three commands used to modify the database:
  - INSERT, DELETE, and UPDATE**
- INSERT** typically inserts a tuple (row) in a relation (table)
- UPDATE** may update a number of tuples (rows) in a relation (table) that satisfy the condition
- DELETE** may also update a number of tuples (rows) in a relation (table) that satisfy the condition

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

44

## INSERT

- In its simplest form, it is used to add one or more tuples to a relation
- Attribute values should be listed in the same order as the attributes were specified in the **CREATE TABLE** command
- Constraints on data types are observed automatically
- Any integrity constraints as a part of the DDL specification are enforced

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7<sup>th</sup> Ed

45

## The INSERT Command

- Specify the relation name and a list of values for the tuple. All values including nulls are supplied.

```
U1: INSERT INTO EMPLOYEE
 VALUES ('Richard','K','Marini','653298653','1962-12-30','98
 Oak Forest, Katy, TX','M',37000,'653298653',4);
```

- The variation below inserts multiple tuples where a new table is loaded values from the result of a query.

```
U3B: INSERT INTO WORKS_ON_INFO (Emp_name, Proj_name,
 Hours_per_week)
 SELECT E.Lname, P.Pname, W.Hours
 FROM PROJECT P, WORKS_ON W, EMPLOYEE E
 WHERE P.Pnumber=W.Pno AND W.Essn=E.Ssn;
```

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7<sup>th</sup> Ed

46

## BULK LOADING OF TABLES

- Another variation of **INSERT** is used for bulk-loading of several tuples into tables
- A new table TNEW can be created with the same attributes as T and using **LIKE** and **DATA** in the syntax, it can be loaded with entire data.

### EXAMPLE

```
CREATE TABLE DSEMPs LIKE EMPLOYEE
 (SELECT E.*
 FROM EMPLOYEE AS E
 WHERE E.Dno=5)
WITH DATA;
```

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7<sup>th</sup> Ed

47

## DELETE

- Removes tuples from a relation
  - Includes a **WHERE**-clause to select the tuples to be deleted
  - Referential integrity should be enforced
  - Tuples are deleted from only *one table* at a time (unless **CASCADE** is specified on a referential integrity constraint)
  - A missing **WHERE**-clause specifies that *all tuples* in the relation are to be deleted; the table then becomes an empty table
  - The number of tuples deleted depends on the number of tuples in the relation that satisfy the **WHERE**-clause

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7<sup>th</sup> Ed

48

## The DELETE Command

- Removes tuples from a relation
  - Includes a **WHERE** clause to select the tuples to be deleted. The number of tuples deleted will vary.

```

U4A: DELETE FROM EMPLOYEE
 WHERE Lname='Brown';
U4B: DELETE FROM EMPLOYEE
 WHERE Ssn='123456789';
U4C: DELETE FROM EMPLOYEE
 WHERE Dno=5;
U4D: DELETE FROM EMPLOYEE;

```

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

49

## UPDATE

- Used to modify attribute values of one or more selected tuples
- A **WHERE**-clause selects the tuples to be modified
- An additional **SET**-clause specifies the attributes to be modified and their new values
- Each command modifies tuples *in the same relation*
- Referential integrity specified as part of DDL specification is enforced

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

50

## UPDATE (contd.)

- Example: Change the location and controlling department number of project number 10 to 'Bellaire' and 5, respectively

```

U5: UPDATE PROJECT
 SET PLOCATION = 'Bellaire',
 DNUM = 5
 WHERE PNUMBER=10

```

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

51

## UPDATE (contd.)

- Example: Give all employees in the 'Research' department a 10% raise in salary.

```

U6: UPDATE EMPLOYEE
 SET SALARY = SALARY * 1.1
 WHERE DNO IN (SELECT DNUMBER
 FROM DEPARTMENT
 WHERE DNAME='Research')

```

- In this request, the modified **SALARY** value depends on the original **SALARY** value in each tuple
  - The reference to the **SALARY** attribute on the right of = refers to the old **SALARY** value before modification
  - The reference to the **SALARY** attribute on the left of = refers to the new **SALARY** value after modification

Comp-3150 Dr. C. I. Ezeife (2019) with Figures and some materials from Elmasri & Navathe, 7th Ed

52

Fig. 6.4: Results of Queries Q11, Q11A, Q16 and Q18

(a)

| Salary |
|--------|
| 30000  |
| 40000  |
| 25000  |
| 43000  |
| 38000  |
