Specifying Constraints in SQL

Basic constraints:

■ Relational Model has 3 basic constraint types that are supported in SQL:

Key constraint: A primary key value cannot be duplicated

Entity Integrity Constraint: A primary key value cannot be null

Referential integrity constraints : The “foreign key “ must have a value that is already present as a primary key, or may be null.

Specifying Attribute Constraints

Other Restrictions on Attribute Domains:

•Default value of an attribute

- Default<value>
- NULL is not permitted for a particular attribute (NOT NULL)

•Check Clause

- Apply to each tuple individually
- Row-Based constraint
- Check (Dept_Create_date <= Mgr_start_date);
- Dnumber INT NOT NULL CHECK (Dnumber >0 AND Dnumber <21)
- Create DOMAIN D_NUM AS INTEGER CHECK D_NUM >0 AND D_NUM <21)

Specifying Key and Referential Integrity Constraints

PRIMARY KEY clause

Specifies one or more attributes that make up the primary key of a relation

```
Dnumber INT PRIMARY KEY;
```

UNIQUE clause

Specifies alternate (secondary) keys (called CANDIDATE Keys in the relational model).

```
Dname VARCHAR(15) UNIQUE;
```

Specifying Key and Referential Integrity Constraints (cont'd.)

FOREIGN KEY clause

Default operation: reject update on violation

Attach **referential triggered action** clause

Options include **SET NULL**, **CASCADE**, and **SET DEFAULT**

Action taken by the DBMS for **SET NULL** or **SET DEFAULT** is the same for both **ON DELETE** and **ON UPDATE**

CASCADE option suitable for “relationship” relations

Giving Names to Constraints

Using the Keyword **CONSTRAINT**

Name a constraint

Useful for later altering

Default attribute values and referential integrity triggered action specification (Fig. 6.2)

```
CREATE TABLE EMPLOYEE
( ... ,
  Dno          INT          NOT NULL      DEFAULT 1,
  CONSTRAINT EMPPK
    PRIMARY KEY (Ssn),
  CONSTRAINT EMPSUPERFK
    FOREIGN KEY (Super_ssn) REFERENCES EMPLOYEE(Ssn)
      ON DELETE SET NULL      ON UPDATE CASCADE,
  CONSTRAINT EMPDEPTFK
    FOREIGN KEY (Dno) REFERENCES DEPARTMENT(Dnumber)
      ON DELETE SET DEFAULT   ON UPDATE CASCADE);

CREATE TABLE DEPARTMENT
( ... ,
  Mgr_ssn CHAR(9)          NOT NULL      DEFAULT '888665555',
  ... ,
  CONSTRAINT DEPTPK
    PRIMARY KEY (Dnumber),
  CONSTRAINT DEPTSK
    UNIQUE (Dname),
  CONSTRAINT DEPTMGRFK
    FOREIGN KEY (Mgr_ssn) REFERENCES EMPLOYEE(Ssn)
      ON DELETE SET DEFAULT   ON UPDATE CASCADE);

CREATE TABLE DEPT_LOCATIONS
( ... ,
  PRIMARY KEY (Dnumber, Dlocation),
  FOREIGN KEY (Dnumber) REFERENCES DEPARTMENT(Dnumber)
      ON DELETE CASCADE      ON UPDATE CASCADE);
```

Basic Retrieval Queries in SQL

SELECT statement

One basic statement for retrieving information from a database

SQL allows a table to have two or more tuples that are identical in all their attribute values

Unlike relational model (relational model is strictly set-theory based)

Multiset or bag behavior

Tuple-id may be used as a key

The SELECT-FROM-WHERE Structure of Basic SQL Queries

Basic form of the SELECT statement:

```
SELECT    <attribute list>  
FROM      <table list>  
WHERE     <condition>;
```

where

- <attribute list> is a list of attribute names whose values are to be retrieved by the query.
- <table list> is a list of the relation names required to process the query.
- <condition> is a conditional (Boolean) expression that identifies the tuples to be retrieved by the query.

The SELECT-FROM-WHERE Structure of Basic SQL Queries (cont'd.)

Logical comparison operators

=, <, <=, >, >=, and <>

Projection attributes

Attributes whose values are to be retrieved

Selection condition

Boolean condition that must be true for any retrieved tuple. Selection conditions include join conditions (see Ch.8) when multiple relations are involved.

Basic Retrieval Queries

Query 1: Retrieve the birthdate and address of the employee(s) whose name is 'John B. Smith'.

James	E	Borg	888665555	1937-11-10	450 Stone, Houston, TX	M	55000	NULL	1

DEPARTMENT

Dname	<u>Dnumber</u>	Mgr_ssn	Mgr_start_date
Research	5	333445555	1988-05-22
Administration	4	987654321	1995-01-01
Headquarters	1	888665555	1981-06-19

Solution of Query 2

```
SELECT Fname, Lname, Address  
FROM EMPLOYEE, DEPARTMENT  
WHERE Dname = 'Research' AND Dnumber = Dno;
```

```
SELECT Fname, EMPLOYEE.Name, Address  
FROM EMPLOYEE, DEPARTMENT  
WHERE DEPARTMENT.Name = 'Research' AND  
DEPARTMENT.Dnumber = EMPLOYEE.Dnumber;
```

```
SELECT EMPLOYEE.Fname, EMPLOYEE.LName,EMPLOYEE.Address  
FROM EMPLOYEE, DEPARTMENT  
WHERE DEPARTMENT.DName = 'Research' AND  
DEPARTMENT.Dnumber = EMPLOYEE.Dno;
```

Aliasing and Renaming

Aliases or tuple variables

Declare alternative relation names E and S to refer to the EMPLOYEE relation twice in a query:

Query 3. For each employee, retrieve the employee's first and last name and the first and last name of his or her immediate supervisor.

```
SELECT E.Fname, E.Lname, S.Fname, S.Lname  
FROM EMPLOYEE AS E, EMPLOYEE AS S  
WHERE E.Super_ssn=S.Ssn;
```

Unspecified WHERE Clause and Use of the Asterisk

Missing WHERE clause

Indicates no condition on tuple selection

Effect is a CROSS PRODUCT

Result is all possible tuple combinations (or the Algebra operation of Cartesian Product– see Ch.8) result

Query 4: Select all Employee Ssns

Select Ssn From Employee; ssss

Query 5: all combinations of Employee Ssn and Department Dname.

Select Ssn, Dname from Employee, Department;

Unspecified WHERE Clause and Use of the Asterisk (cont'd.)

Specify an asterisk (*)

Retrieve all the attribute values of the selected tuples

The * can be prefixed by the relation name; e.g., EMPLOYEE *

Q1C: **SELECT** *

FROM EMPLOYEE

WHERE Dno=5;

Q1D: **SELECT** *

FROM EMPLOYEE, DEPARTMENT

WHERE Dname='Research' **AND** Dno=Dnumber;

Q10A: **SELECT** *

FROM EMPLOYEE, DEPARTMENT;

Tables as Sets in SQL

SQL does not automatically eliminate duplicate tuples in query results

Use the keyword `DISTINCT` in the `SELECT` clause

Only distinct tuples should remain in the result

Query 11. Retrieve the salary of every employee (Q11) and all distinct salary values (Q11A).

Q11: **SELECT** **ALL** Salary
 FROM **EMPLOYEE;**

Q11A: **SELECT** **DISTINCT** Salary
 FROM **EMPLOYEE;**

Tables as Sets in SQL (cont'd.)

Set operations

UNION, EXCEPT (difference), **INTERSECT**

Corresponding multiset operations: **UNION ALL, EXCEPT ALL, INTERSECT ALL**)

Type compatibility is needed for these operations to be valid

Query 4. Make a list of all project numbers for projects that involve an employee whose last name is 'Smith', either as a worker or as a manager of the department that controls the project.

```
Q4A: ( SELECT   DISTINCT Pnumber
      FROM     PROJECT, DEPARTMENT, EMPLOYEE
      WHERE    Dnum=Dnumber AND Mgr_ssn=Ssn
              AND Lname='Smith' )

      UNION

      ( SELECT   DISTINCT Pnumber
      FROM     PROJECT, WORKS_ON, EMPLOYEE
      WHERE    Pnumber=Pno AND Essn=Ssn
              AND Lname='Smith' );
```

Substring Pattern Matching and Arithmetic Operators

LIKE comparison operator

Used for string **pattern matching**

% replaces an arbitrary number of zero or more characters

underscore (_) replaces a single character

Examples: **WHERE** Address **LIKE** '%Houston,TX%';

WHERE Ssn **LIKE** '__ 1__ 8901';

BETWEEN comparison operator

E.g., : **WHERE**(Salary **BETWEEN** 30000 **AND** 40000) **AND** Dno = 5;

Arithmetic Operations

Standard arithmetic operators:

Addition (+), subtraction (-), multiplication (*), and division (/) may be included as a part of **SELECT**

Query. Show the resulting salaries if every employee working on the 'ProductX' project is given a 10 percent raise.

```
SELECT E.Fname, E.Lname, 1.1 * E.Salary AS Increased_sal  
FROM EMPLOYEE AS E, WORKS_ON AS W, PROJECT AS P  
WHERE E.Ssn=W.Essn AND W.Pno=P.Pnumber AND  
P.Pname='ProductX';
```

Ordering of Query Results

Use ORDER BY clause

Keyword **DESC** to see result in a descending order of values

Keyword **ASC** to specify ascending order explicitly

Typically placed at the end of the query

```
ORDER BY D.Dname DESC, E.Lname ASC, E.Fname ASC
```

```
SELECT    <attribute list>  
FROM      <table list>  
[ WHERE   <condition> ]  
[ ORDER BY <attribute list> ];
```

Viewing two Attributes

```
SELECT Fname|| ' ' ||Lname AS "Employee Full Name"  
FROM employee ;
```

```
SELECT Fname || ' ('|| (Salary)||') '|| AS "Employee"  
FROM employee;
```
